

Z Motor Adjustment

[JellyBox HowTo: Z Motor Adjustment](#)

Title: Adjusting the Z Motor

Now that the whole JellyBox is assembled, the Z motor position can be fine-tuned. If they aren't already loose, use an M3 hex key to loosen the bolts securing the Z motor to the bottom. Gently move the X assembly up and down to allow the motor to self-adjust to its ideal position. Keep the X assembly low for the most leverage. The movements don't need to be large - a few millimeters will do the job. When everything is moving smoothly and the leadscrew looks nice and straight, secure the Z motor in place.
